Axmed

AI Engineer

Building production-grade AI agents that solve real-world problems is exactly what drives me. Having developed and deployed an AI-powered e-commerce platform that integrates LLMs for personalized recommendations and virtual assistance, I understand the balance between technical innovation and operational reliability. My experience in shipping end-to-end solutions—from the initial architecture to monitoring performance in production—aligns perfectly with your need for an engineer who owns the full lifecycle of procurement automation.

I am particularly drawn to Axmed's mission of democratizing access to medicine. I thrive in environments where I can translate complex operational workflows into efficient, agentic systems. Whether it is implementing human-in-the-loop checkpoints or optimizing latency and reliability for live transactions, I focus on building robust systems that provide tangible value rather than just prototyping.

My technical background in Python, combined with my experience in deploying scalable web applications, has prepared me to tackle the challenges of your procurement marketplace. I am eager to bring my builder's mindset to your team and contribute to creating equitable healthcare solutions. I would welcome the opportunity to discuss how my experience with LLM integration and autonomous workflows can help Axmed scale its impact. Are you available for a brief conversation next week to explore how I can contribute to your engineering goals?

Atentamente,

Jorge Jaime Sena
