Affirm

Software Engineer I, Fullstack (Servicing International)

Building scalable, user-centric solutions is what drives me, and Affirm's mission to make financial services more honest and accessible resonates deeply with my own approach to software development. Having developed full-stack applications from the ground up—including a production-ready e-commerce platform with integrated AI assistants—I am eager to bring my technical background to the Servicing International team to help build the next generation of global financial tools.

My experience aligns well with the requirements for this role. I have hands-on experience building responsive web interfaces and designing backend logic, and I am comfortable working with the modern stacks that Affirm utilizes. Whether it is debugging complex systems or collaborating on agent tooling to improve customer support, I thrive in environments that prioritize clean, extensible code and proactive problem-solving. My background in both web and desktop development has taught me how to navigate large codebases and deliver reliable, performant features.

I am particularly excited about the challenge of launching products in new international markets and contributing to a global engineering culture. I am a fast learner who takes full ownership of my growth, and I am ready to contribute to the team's goals while participating in on-call rotations to ensure system reliability. I would welcome the opportunity to discuss how my technical skills and passion for building impactful software can support Affirm's continued expansion.

Atentamente,

Jorge Jaime Sena
