Civil Service World

Junior Software Developer - Met Office

Building robust software solutions that solve real-world problems is what drives me. My experience developing full-stack applications, such as the 'El Grano de Oro' e-commerce platform, has allowed me to master the integration of complex features like AI-driven recommendation engines and automated notification systems. I am particularly drawn to the Met Office's mission, as I am eager to apply my technical background in JavaScript, Java, and SQL to high-impact projects that require precision and scalability. Beyond my formal education in Multiplatform Application Development and Industrial Engineering, I have consistently pushed myself to deploy production-ready tools, including desktop applications for data management and corporate web solutions. My ability to bridge the gap between technical architecture and user-centric design, combined with my C1 English proficiency, ensures that I can contribute effectively to your international development teams from day one. I am confident that my proactive approach to learning and my hands-on experience with Docker and database management will allow me to add immediate value to your engineering department. I would welcome the opportunity to discuss how my technical skills and passion for automation align with the innovative work being done at the Met Office. Are you available for a brief conversation next week to explore how I can support your current development goals?

Atentamente,

Jorge Jaime Sena
