Quinnacia Inc

Frontend Developer

Building products that solve real-world problems is what drives me, and Quinnacia's mission to bridge the gap for recent graduates resonates deeply with my own experience as a developer. I have spent the last few years building full-stack applications from scratch, including an AI-powered e-commerce platform that integrates complex features like virtual assistants and automated notifications. My technical foundation is built on JavaScript, TypeScript, and React.js, and I am comfortable managing the entire lifecycle of a project, from UI/UX design to deployment. In my recent projects, I have utilized Next.js for performance and CSS for responsive design, ensuring that the end-user experience is both intuitive and reliable. I am also well-versed in testing with Jest and managing build processes with Webpack, which allows me to maintain high code quality and scalability. I am particularly excited about the opportunity to contribute to your frontend team, as I enjoy the challenge of optimizing UI/UX and implementing complex features like data visualization and AI integration. My background in engineering and my hands-on approach to development mean I am always ready to learn new paradigms and automate workflows to improve efficiency. I would love to discuss how my technical skills and passion for building impactful software can contribute to the continued success of Quinnacia. Are you available for a brief conversation next week to explore how I can support your team?

Atentamente,

Jorge Jaime Sena
