Graduate/Junior Software Engineer - Backend

Building robust backend systems is where I thrive, and my experience developing production-ready applications has prepared me to contribute effectively to your engineering team. In my recent project, 'El Grano de Oro,' I architected a full-stack solution that integrates AI-driven recommendation engines and automated email notification systems, ensuring a seamless user experience from the database layer to the frontend. My technical foundation in Java, JavaScript, and SQL, combined with my proficiency in Docker for containerization, allows me to build scalable and maintainable software architectures. I am particularly drawn to this role because it aligns with my passion for backend optimization and complex problem-solving. Beyond my academic background in Industrial Engineering and Software Development, I have spent my time building tools like my desktop music management application, which demonstrates my ability to handle end-to-end development cycles independently. I am eager to bring my proactive mindset and technical versatility to your team to help drive high-quality software delivery. I would welcome the opportunity to discuss how my background in backend development and AI integration can support your current projects. Are you available for a brief conversation next week to explore how I can contribute to your team?

Atentamente,

Jorge Jaime Sena
